

Rushville City Utilities / EMC

Rushville City Utilities and Environmental Management Corporation (EMC) works vigilantly to provide a reliable, plentiful supply of safe drinking water every day. This annual drinking water quality report is designed to show City Utilities customers how successfully that goal was achieved during 2009. City Utilities record is one that reflects the commitment of our employees to provide safe, healthy water for the community in which they also live. This report meets the federal Safe Drinking Water Act (SDWA) requirement for Consumer Confidence Reports and contains information on the source of our water, its quality and the health risks associated with any contaminants in our water. Safe water is vital to our community. Please read this report carefully and, if you have questions, call the numbers listed in this report.

The source of Rushville's drinking water is groundwater produced at two well fields. The South Well Field consists of three wells located adjacent to the Flat-rock River and the North Well Field consists of two wells located in Memorial Park. Both well fields produce from a shallow sand and gravel aquifer.

To protect this aquifer from potential contamination, Rushville City Utilities has developed a wellhead protection plan. This community-based plan helps protect our source of drinking water through a program of pollution prevention. Watch for information and updates regarding this program in future issues of the Rushville Republican.

Sources of drinking water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants such as salts and metals which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, storm water runoff, and residential uses.
- Organic chemicals, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production and can also come from gas stations, urban storm water runoff, and septic systems.
- Radioactive materials, which can be naturally occurring or be the result of oil and gas production and mining activities.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at (800) 426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immune-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

We want our valued customers to be informed about their water utility. If you have any questions about this report, concerning your water utility, or if you would like information regarding boil water advisories visit our website at www.cityofrushville.com or the wellhead protection program, please contact Leslie Day at (765) 932-4124. If you want to learn more, you are welcome to attend any of our regularly scheduled Utility Board meetings held at 6:00 PM on the third Wednesday of each month

Lead: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Rushville Utilities is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing. When your water has been sitting for several hours, you can minimize the exposure by flushing your tap for 1 to 2 minutes prior to drinking or cooking.. If you are concerned about lead in your drinking water, have it tested. Information is available at the Safe Drinking Water Hotline at (800)426-4791 or at www.epa.gov/safewater/lead.

All of us at Rushville City Utilities work diligently every day to provide top quality water to every tap. We ask that our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

Parameter	Violation Yes / No	Maximum Level Detected	Unit of Measure	MCLG	MCL	Likely Source of Substance in Drinking Water
<u>Inorganic Constituents</u>						
Barium 2009	No	0.154	PPM	2	2	Erosion of natural deposits.
Copper 2008	No	0.169 ⁽¹⁾	PPM	1.3	AL= 1.3	Corrosion of household plumbing systems; erosion of natural deposits.
Lead 2008	No	0.0037 ⁽¹⁾	PPM	0	AL- .015	Corrosion of household plumbing systems; erosion of natural deposits.
Fluoride 2009	No	1.3 ⁽²⁾	PPM	4	4	Water additive, which promotes strong teeth.
Nitrate-N 2009	No	0.159	PPM	10	10	Runoff from fertilizer use; erosion of natural deposits.
Sodium 2010	No	13.9	PPM	N/A	N/A	Erosion of natural deposits.
Sulfate 1994	No	.023	PPM	N/A	N/A	Erosion of natural deposits.
<u>Volatile Organic Constituents</u>						
Total (HAA5) 2009	No	0.0	ppb	N/A	.06 ppm	By-product of drinking water chlorination.
Trihalomethanes (TTHM) 2009	No	1.5	ppb	N/A	.08 ppm	By-product of drinking water chlorination.
<p>Table Notes:</p> <p>⁽¹⁾ - Level reported for Copper and Lead represents the 90th percentile value as calculated from a total of 20 samples.</p> <p>⁽²⁾ - Levels of Fluoride detected range from .7- 2.1 PPM.</p> <p>All other tested contaminants were below detection limits.</p> <p>All analyses performed in 2009 except for Lead and Copper, in 20068 Sulfate which was sampled in 94,. The state allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Therefore, some of the data while representative, is more than one year old.</p>						
<p>Included in the table above, you will find terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:</p> <p>Not Applicable (N/A) - no MCLG or MCL had been established for these unregulated constituents.</p> <p>Parts per million (PPM) - one part per million corresponds to one minute in two years or a single penny in \$10,000.</p> <p>Parts per billion (PPB) - one part per billion corresponds to one minute in two thousand years or a single penny in \$10,000,000.</p> <p>Action Level (AL) - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which there is no known or expected risk to health. MCLG's allow for a margin of safety.</p> <p>Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLG's allow for a margin of safety.</p> <p>Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCL's are set as close to the MCLG's as feasible using the best available treatment technology. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the health effect.</p>
